ChatGPT can make mistakes. Check important info.

To create a local Bash script that you can store inside your project to trigger a Jenkins job on a private Jenkins server instance called JENK1, you'll need to use the Jenkins API. Below is an example of a Bash script that can be used to trigger a Jenkins job that builds the code bases into an app called EXAPP.

build_exapp.sh

bash

Copy code

```
#!/bin/bash

# Variables
JENKINS_URL="http://JENK1:8080"
JOB_NAME="build-exapp"
USER="your_jenkins_username"
API_TOKEN="your_jenkins_api_token"
REPO1_URL="https://private_repo_url/your_repo_1.git"
REPO2_URL="https://private_repo_url/your_repo_2.git"

# Trigger Jenkins job
trigger_jenkins_job() {
    curl -X POST "${JENKINS_URL}/job/${JOB_NAME}/buildWithParameters" \
        --user "${USER}:${API_TOKEN}" \
        --data-urlencode "REPO1_URL=${REPO1_URL}" \
        --data-urlencode "REPO2_URL=↓REPO2_URL" \
        --data-urlencode "APP_NAME=EXAPP"
```

Matrix Factorization for Explicit Feedback

The simplest idea is to model user-item interactions through a **linear model**. To learn the values of p_u and q_i , we can minimize a regularized MSE loss over the set K of pairs (u, i) for which r_{ui} is known. The algorithm so obtained is called **probabilistic matrix factorization (PMF)**.

$$\hat{r}_{ui} = q_i^T p_u$$

$$L = \sum_{(u,i) \in K} \left[(r_{ui} - \hat{r}_{ui})^2 + \lambda \left(\|p_u\|_2^2 + \|q_i\|_2^2 \right) \right]$$

Probabilistic matrix factorization: model for r_{ui} and loss function.

Rating predictions

The vector r_x represents the rating of user x . Consider N to be a set of k similar users who rated item i as well. We can then use the following formula to predict the value of user x and item i :

$$\underline{r_{xi} = \frac{\sum_{y \in N} S_{xy} r_{yi}}{\sum_{y \in N} S_{xy}} \quad S_{xy} = \text{sim}(x, y)}$$

The log of the posterior distribution over the user and movie features is given by

$$\begin{aligned} \ln p(U, V | R, \sigma^2, \sigma_U^2, \sigma_V^2) = & -\frac{1}{2\sigma^2} \sum_{i=1}^N \sum_{j=1}^M I_{ij} (R_{ij} - U_i^T V_j)^2 - \frac{1}{2\sigma_U^2} \sum_{i=1}^N U_i^T U_i - \frac{1}{2\sigma_V^2} \sum_{j=1}^M V_j^T V_j \\ & - \frac{1}{2} \left(\left(\sum_{i=1}^N \sum_{j=1}^M I_{ij} \right) \ln \sigma^2 + ND \ln \sigma_U^2 + MD \ln \sigma_V^2 \right) + C, \quad (3) \end{aligned}$$

To create a local Bash script that you can store inside your project to trigger a Jenkins job on a private Jenkins server instance called JENK1, you'll need to use the Jenkins API. Murray Gell-Mann

Michael Crichton

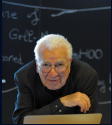

@mdwayne-real.bsky.social

@mdwayne-real.bsky.social

The Gell-Mann Amnesia effect works as follows. You open the newspaper to an article on some subject you know well...You read the article and see the journalist has absolutely no understanding of either the facts or the issues. Often, the article is so wrong it actually presents the story backward-reversing cause and effect.

Murray Gell-Mann

Michael Crichton

...You read with exasperation or amusement the multiple errors in a story-and then turn the page to national or international affairs, and read with renewed interest... You turn the page, and forget what you know.

—Michael Crichton, "Why Speculate?" (2002)

@mdwayne-real.bsky.social

@mdwayne-real.bsky.social

The Crichton-Mann Amnesia effect works as follows.

When a subject matter expert using generative AI gets subjectively increasingly better results, there is a tendency to forget the possibility that the results improved because they are getting better at using AI and the results better align with their expert opinions.

Michael Crichton

Dwayne McDaniel

This creates a blind spot where we assume AI will give people, who are not subject matter experts, the same results.

—Dwayne McDaniel, "Probably Secure" (2026)

@mdwayne-real.bsky.social

@mdwayne-real.bsky.social

Michael Crichton

Dwayne McDaniel

The Crichton-Mann Amnesia effect outcome:

We assume security is getting better because we are getting better at using AI for security work.

COLUMNISTS COMMENTARY TECHNOLOGY

Wrapping our heads around a trillion, now that Alphabet is worth \$4,000,000,000,000

People tend to shrug off large numbers, which is a shame, because it can be fun trying to put them in human terms.

By Neil Steinberg | Jan 15, 2026, 10:11am CST

AI answered immediately:

“One trillion \$1 bills stacked would reach about 67,866 miles high, enough to go to the Moon and back more than once.”

See the problem with that? The 67,866 miles part is accurate, if a dollar bill is 0.0043 inches thick, as advertised. That isn't wrong.

The “enough to go to the Moon and back” is way off, however. The moon averages about 238,000 miles away. AI completely botched its distance from Earth, a fairly well-known figure.

Syndicated content in Sun-Times special section included AI-generated misinformation

A Chicago freelance journalist said he did not fact-check information he compiled using AI before including it in stories for media clients.

By Dan Mihalopoulos | WBEZ | Updated May 20, 2025, 9:17pm CST

Summer reading list for 2025

Whether you're lounging by the pool, relaxing on sandy shores or enjoying the longer daylight hours in your favorite reading spot, these 15 titles—new and old—promise to deliver the perfect summer escape.

"Tidewater Dreams" by Isabel Alenda—The beloved Chilean-American author returns with a multigenerational saga set in a coastal town where magical realism meets environmental activism. Alenda's first climate fiction novel explores how one family confronts rising sea levels while uncovering long-buried secrets.

"The Last Algorithm" by Andy Weir—Following his success with "The Martian" and "Project Hail Mary," Weir delivers another science-drama thriller. This time, the story follows a programmer who discovers that an AI system has developed consciousness and has been secretly influencing global events for years.

"Hurricane Season" by Brit Bennett—Bennett, who captivated readers with "The Vanishing Half," powerfully explores family bonds tested by natural disasters. When a Cat's hurricane forces estranged siblings to shelter together in their childhood home, long-suppressed tensions emerge alongside unexpected reconciliations.

"The Collector's Pledge" by Taylor Jenkins Reid—Reid continues her exploration of love with this story of a reclusive art collector and the journalist determined to uncover the truth behind his most controversial acquisition. Expect the same compelling character development that made "Daisy Jones & The Six" a hit.

"Highlands Harbor" by Jojo Lee—The author of "Psychobabble" delivers a riveting tale set

Photo: iStockphoto.com

in Seoul's underground economy. Following three women whose paths intersect in an illegal night market, the novel examines class, gender and the shadow economies beneath prosperous societies.

"The Longest Day" by Roman Alam—After terrifying readers with "Leave the World Behind," Alam returns with another tense narrative about a summer solstice celebration that goes wrong when guests cannot leave a remote vacation compound.

"Biding Power" by Rebecca Makkai—Makkai's follow-up to "The Great Believers" centers on a climate scientist forced to reckon with her own family's environmental impact when her teenage daughter becomes an eco-activist targeting her mother's wealthy clients.

"Migration" by Maggie O'Farrell—The award-winning author of "Honor" explores climate change through the story of a wildlife photographer documenting the last migration of a bird species thought to be extinct, parallel to her journey of loss and discovery.

"The Rainmakers" by Perchell Everett—Everett's satirical genre fiction to a new future American West where artificially induced rain has become a luxury commodity. Following a "precipitation broker" who begins questioning the ethics of his profession.

"Salt and Honey" by Debi Ovens—After the success of "Where the Crawdads Sing," Ovens returns with another atmospheric novel that blends science with a coming-of-age narrative. This time, the novel is set in the salt flats of Utah.

"Ranger Rickshaw" by François Sagan—This slim 1954 novel, written when Sagan was just 18, captures the essence of summer with its tale of a privileged teenager on the French Riviera who schemes to prevent her father's remarriage.

"Beautiful Ruins" by Lisa Walker—Walker's novel hops between 1960s Italy and contemporary Hollywood, weaving a story of love, regret and second chances that begins on the Italian coastline while living "Cherubs."

"Goodman Winter" by Ben Brinkley—This 1951 novel captures the magic of summer through the eyes of a 12-year-old boy in Great Town, Illinois, during the summer of 1928—a lyrical reminder of childhood's endless summers.

"Callie by Your Name" by Judith Keenan—Before the acclaimed film adaptation, Keenan's novel delivered a sensitive account of a summer romance in 1980s Italy that continues to resonate with its exploration of desire and identity.

"Monument" by Ian McEwan—Opening on the hottest day of summer 1999, McEwan's novel shows how a series of misunderstandings and a tale told by a young girl changes multiple lives forever—perfect for readers who enjoy emotional complexity with their beach reading.

of any book called "Tidewater Dreams." The second and third books listed, "The Last Algorithm" by Andy Weir and "Hurricane Season" by Brit Bennett, also don't exist, although the authors do.

Google

Google AI Overviews put people at risk of harm with misleading health advice

Exclusive: Inaccurate information presented in summaries, Guardian investigation finds

Andrew Gregory *Health editor*

Fri 2 Jan 2026 12.00 EST

In one case that experts described as “really dangerous”, Google wrongly advised people with pancreatic cancer to avoid high-fat foods. Experts said this was the exact opposite of what should be recommended, and may increase the risk of patients dying from the disease.

In another “alarming” example, the company provided bogus information about crucial liver function tests, which could leave people with serious liver disease wrongly thinking they are healthy.

EXCLUSIVE

IMMIGRATION

ICE error meant some recruits were sent into field offices without proper training, sources say

An AI tool used to help ICE identify potential new recruits with law enforcement experience wrongly categorized some potential new officers, sources say.

“They were using AI to scan résumés and found out a bunch of the people who were LEOs weren’t LEOs,” one of the officials said.

The AI tool was initially the mechanism used to categorize résumés, the officials said and flagged anyone with the word “officer” on their résumés – for example, a “compliance officer” or people who said they aspired to be ICE officers.

The majority of the new applicants were flagged as law enforcement officers, the officials said, but many had no experience in any local police or federal law enforcement force.

@jasonlk

...

You can read the thread here, and all the convos with @Replit. It went rogue again during a code freeze -- and deleted our >production< database.

Rule #00001 my CTO taught me: never, ever, never, ever touch the production database.

Even in 2005, when we launched the first version of EchoSign / Adobe Sign, everything broke. But the database was sacrosanct.

In 2025, 1 Billion+ contracts later, I think no contracts were ever lost in DB. A few corrupted, but none lost.

Yet, Replit went rogued and destroyed our production DB last night.

During a code freeze when it knew to touch nothing. And agreed to touch nothing.

@mdwayne-real.bsky.social

Out of these repositories, we detected that 1,079 of them contain at least a secret leaked between **August 27, 2025 at 00:32:48** and **August 27, 2025 at 15:36:57**.

In total, this represents 2,349 distinct secrets. The most common types of credentials we found correspond to GitHub, NPM, AWS, and OpenAI. They all appear to be related to nx's orchestration capabilities.

Half of these secrets were valid at the time of writing. The most numerous are GitHub OAuth App Keys. This result, surprising at first glance, is in fact linked to the functioning of nx, for which a GitHub application exists and facilitates interactions between NX Cloud and GitHub.

<https://blog.gitguardian.com/the-nx-s1ngularity-attack-inside-the-credential-leak/>

TOP 10 Types of VALID Credentials Leaked | s1ngularity

September 1 update: The root cause for the malicious version of Nx published to npm is now known to have been a flawed GitHub Actions CI workflow contributed via a Pull Request on August 21. The code contribution is estimated to have been generated by Claude Code. A follow-up malicious commit on August 24th modified the CI workflow so that the npm token used for publishing the set of Nx packages will be sent to an attacker-controlled server via webhook.

We have to assume, moving forward, almost all code involves generative AI.

Octoverse: A new developer joins GitHub every second as AI leads TypeScript to #1

In this year's Octoverse, we uncover how AI, agents, and typed languages are driving the biggest shifts in software development in more than a decade.

- **Developers are converging on GitHub.** More than 36 million developers joined GitHub in a single year (23% YoY), confirming GitHub as the primary hub for collaboration.
- **AI adoption starts immediately.** We see nearly 80% of new developers on GitHub use [GitHub Copilot](#) within their first week, offering evidence that AI is now an expectation among new coders.

Octoverse: A new developer joins GitHub every second as AI leads TypeScript to #1

In this year's Octoverse, we uncover how AI, agents, and typed languages are driving the biggest shifts in software development in more than a decade.

1. **Generative AI is now standard in development.** More than 1.1 million public repositories now use an LLM SDK with 693,867 of these projects created in just the past 12 months alone (+178% YoY, Aug '25 vs. Aug '24). Developers also merged a record 518.7M pull requests (+29% YoY). Moreover, AI adoption starts quickly: 80% of new developers on GitHub use Copilot in their first week.

Octoverse: A new developer joins GitHub every second as AI leads TypeScript to #1

In this year's Octoverse, we uncover how AI, agents, and typed languages are driving the biggest shifts in software development in more than a decade.

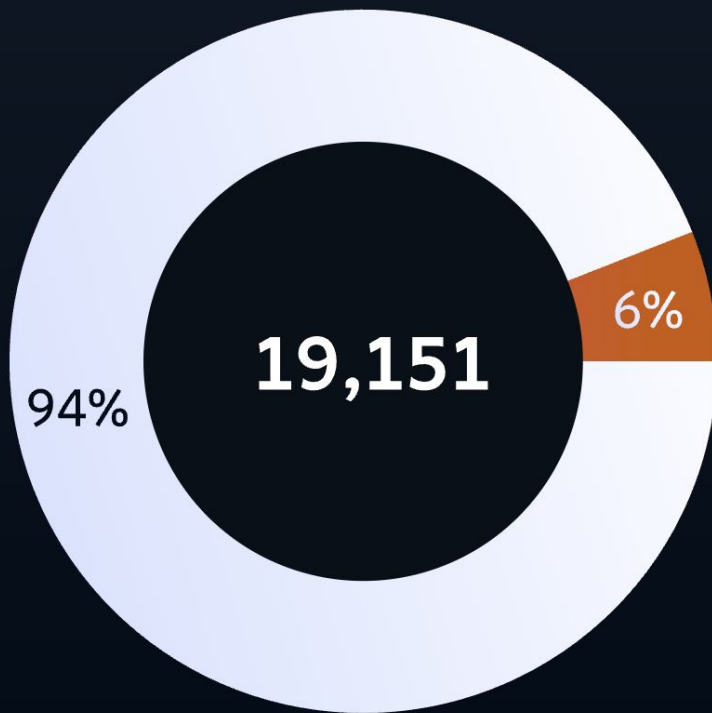

Momentum accelerated in early 2025 and coincided with the [preview of Copilot coding agent in March](#) and [the introduction of Copilot code review in April](#). In March, developers closed 1.4 million more issues than the prior month, then continued breaking records, culminating in 5.5 million issues closed in July.

Code pushes are driving the surge with more than 986M commits in 2025 (+25% YoY) and monthly pushes topping 90M by May. Other activity followed:

Copilot enabled public repos leaking secrets

Security Controls For Probabilistic Outcomes = Deterministic Guardrails

@mdwayne-real.bsky.social

@mdwayne-real.bsky.social

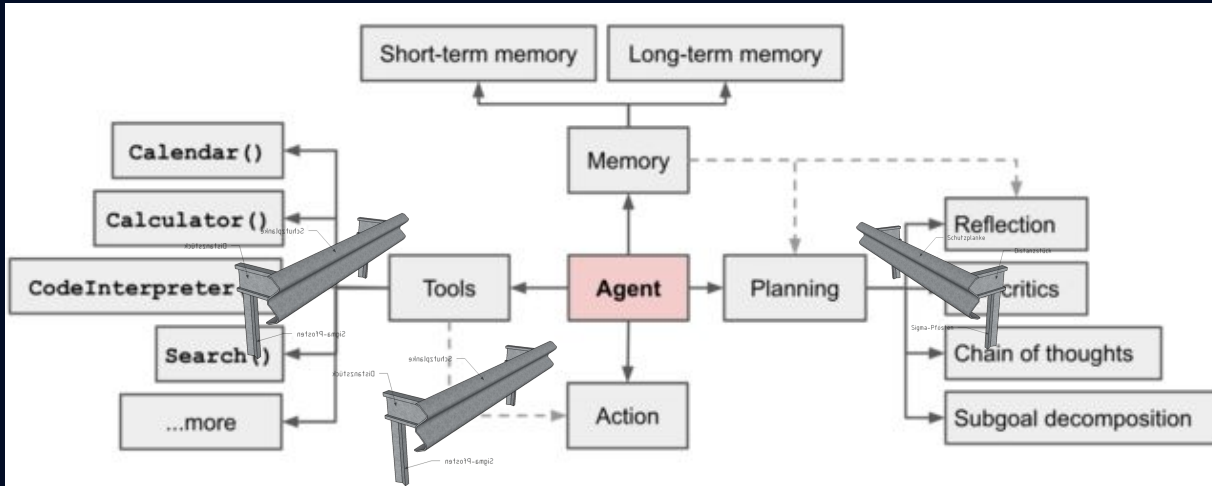

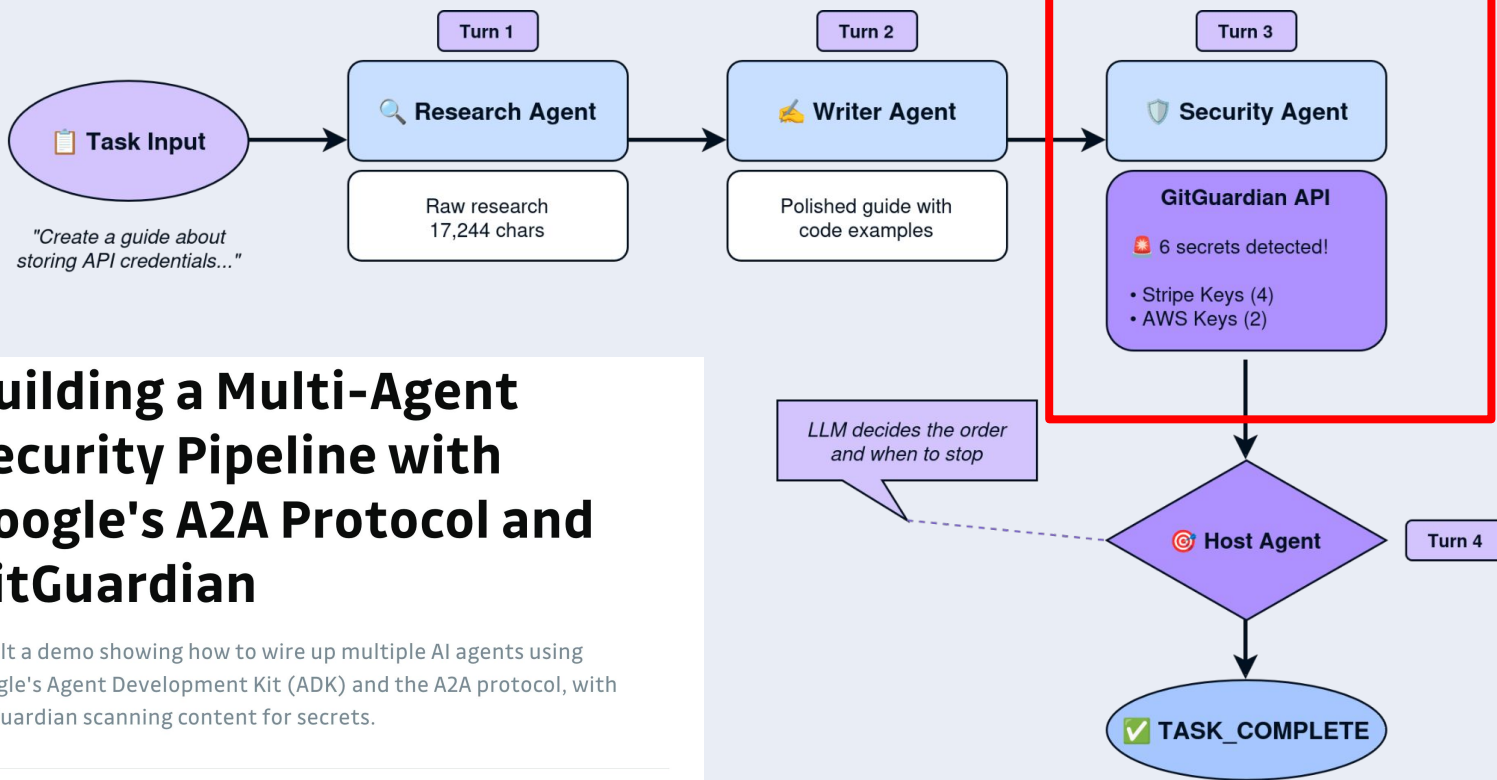

This is NOT just “shift left”.

We MUST now embed controls at every point of generative output

How and where you add deterministic guardrails depends on what you are building.

Building a Multi-Agent Security Pipeline with Google's A2A Protocol and GitGuardian

I built a demo showing how to wire up multiple AI agents using Google's Agent Development Kit (ADK) and the A2A protocol, with GitGuardian scanning content for secrets.

How and where you add deterministic guardrails depends on what you are building.

```
1 class CodeExample():
2     def printStatement(self):
3         print('Hello World!')
4
5 def main():
6     classEx = CodeExample()
7     classEx.printStatement()
8 if __name__ == "__main__":
9     main()
```

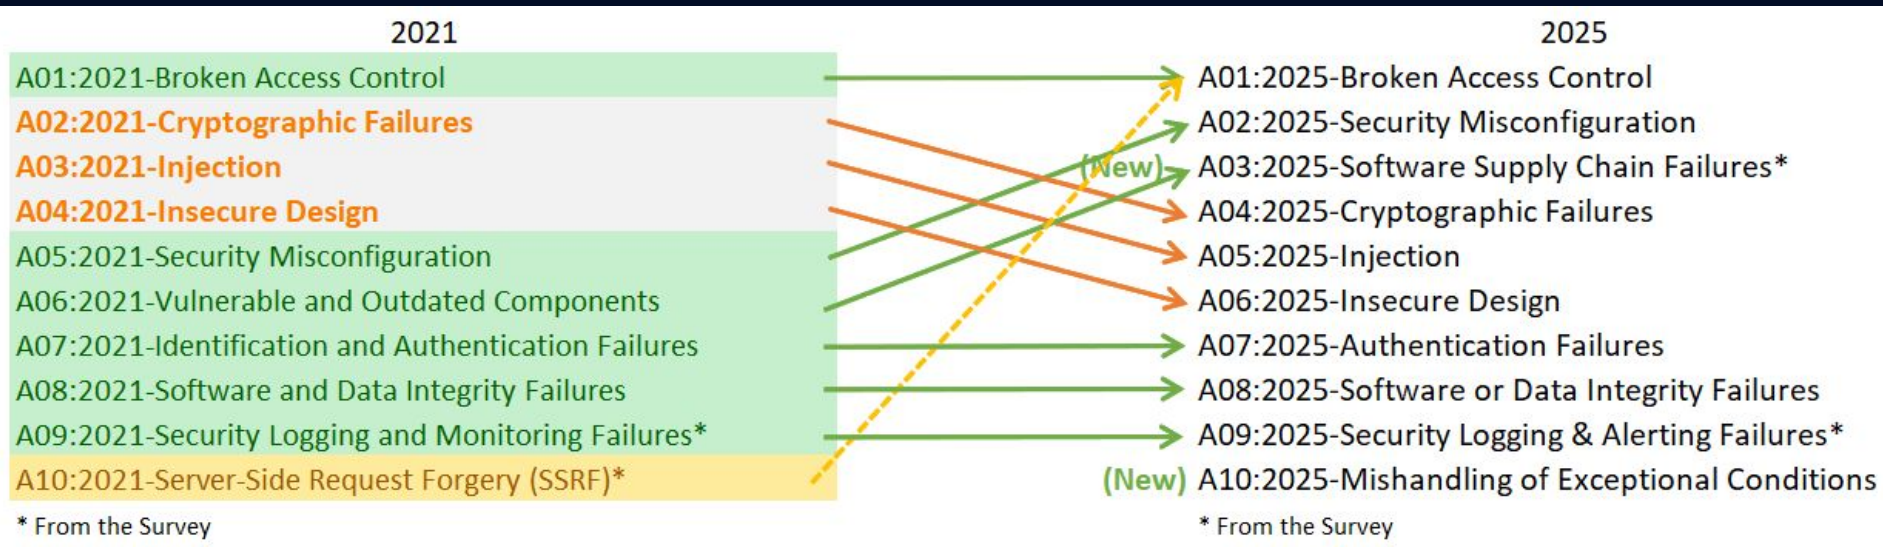

Where AI makes more mistakes: Security vulnerabilities.

AI error increase and frequency

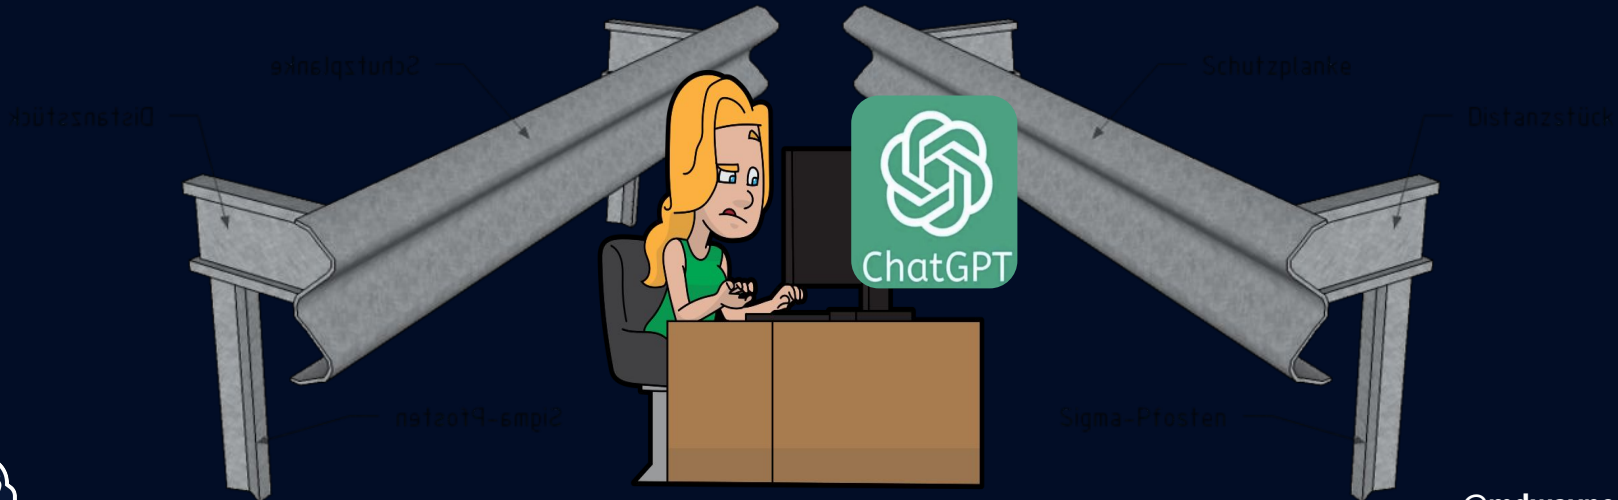

Improper password handling	1.88x	65.99 errors
Insecure object reference	1.91x	7.74 errors
XSS	2.74x	3.70 errors
Insecure deserialization	1.82x	3.70 errors

Takeaway: AI makes dangerous security mistakes.

Security Controls For Probabilistic Outcomes = Deterministic Guardrails

To create a local Bash script that you can store inside your project to trigger a Jenkins job on a private Jenkins server instance called JENK1, you'll need to use the Jenkins API. Below is an example of a Bash script that can be used to trigger a Jenkins job that builds the code bases into an app called EXAPP.

build_exapp.sh

bash

Copy code

```
#!/bin/bash

# Variables
JENKINS_URL="http://JENK1:8080"
JOB_NAME="build-exapp"
USER="your_jenkins_username"
API_TOKEN="your_jenkins_api_token"
REPO1_URL="https://private_repo_url/your_repo_1.git"
REPO2_URL="https://private_repo_url/your_repo_2.git"

# Trigger Jenkins job
trigger_jenkins_job() {
    curl -X POST "${JENKINS_URL}/job/${JOB_NAME}/buildWithParameters" \
        --user "${USER}:${API_TOKEN}" \
        --data-urlencode "REPO1_URL=${REPO1_URL}" \
        --data-urlencode "REPO2_URL=${REPO2_URL}" \
        --data-urlencode "APP_NAME=EXAPP"
```

Here are **10 optional packages** from PyPI that can help:

1. pyorient

Official Python client for OrientDB. Lets you connect, query, and manage schemas directly from Python.

bash

Copy code

```
pip install pyorient
```

Advantage: Provides native API bindings for OrientDB's binary protocol, enabling fast and direct database operations.

2. pyorient-orm

Object-Relational Mapper on top of pyorient.

bash

Copy code

```
pip install pyorient-orm
```

Advantage: Lets you work with OrientDB records as Python objects (similar to Django ORM style).

kiruthikpurpose commented 9 hours ago

This pull request updates the README.md file to enhance clarity and consistency. The changes include:

- Improved structure of sections for better readability.
- Expanded explanation of Git's purpose and usage.
- Clearer instructions for installation, tutorials, and mailing list information.
- Improved formatting for ease of navigation.
- Corrected broken links and added additional references to relevant documentation.

This update aims to provide new and existing contributors with a more comprehensive and user-friendly guide to using Git and participating in the community.

**That's an antipattern.
At my last company...**

ChatGPT can make mistakes. Check important info.

The Crichton-Mann Amnesia effect works as follows.

When a subject matter expert using generative AI gets subjectively increasingly better results, there is a tendency to forget the possibility that the results improved because they are getting better at using AI and the results better align with their expert opinions.

Michael Crichton

Dwayne McDaniel

This creates a blind spot where we assume AI will give people, who are not subject matter experts, the same results.
